

ABSTRACT

A kit of parts including shortened side panels and a roof panel is provided for installation on a highway truck tractor which is being converted from a sleeper cab configuration to a day cab configuration. The kit of parts is particularly
5 useful when converting an integral sleeper cab which requires that the frame and floor be shortened before installation of the components of the conversion kit. When the replacement components are provided in the form of a kit, conversions from sleeper cab to day cab can readily be accomplished in a cost effective manner to realize many benefits recognized with conversion from sleeper cabs to day cabs
10 already being done with non-integral types of sleeper cabs.
